Calibration enables the units of measurement on your equipment, like the inch or meter, to be traced back to some official reference (like NIST in the U.S.).

In measurement technology and metrology, calibration is the comparison of measurement values delivered by a device under test with those of a calibration standard of known accuracy.

What Is Calibration? Calibration involves the comparison of a measuring instrument with a known accurate standard to identify any discrepancies and make necessary adjustments. This procedure ...

What Is Calibration? Calibration is configuring and verifying a measuring instrument's accuracy to ensure its readings match a known standard. Calibration is a foundational practice across ...

Calibration is a measurement process that assigns values to the property of an artifact or to the response of an instrument relative to reference standards or to a designated measurement process.

Calibration is the process of comparing the readings of a measuring instrument with a known standard value and making adjustments if needed. It ensures that the instrument gives correct ...

Learn about the meaning of calibration, calibration uncertainty, traceability, why and how often to calibrate and how to calibrate.

Calibration is the process of adjusting and verifying the accuracy of a measuring instrument or system, such as an electronic device or sensor, to ensure that it provides the correct ...
