Want to know how to build an energy storage project that actually makes sense (and dollars)? You're not alone. With global energy storage capacity projected to hit 1.3 TWh by 2030, ...

U.S. energy storage capacity will need to scale rapidly over the next two decades to achieve the Biden-Harris Administration's goal of achieving a net-zero economy by 2050.

The average project now begins commercial operations just under 20 months from the start of construction. The fastest can achieve this 30% sooner. Commissioning has the largest range ...

The scale of necessary infrastructure and the short timeline adopted for implementation call for swift and extensive enactment. For example, California alone needs ...

Electrical Energy Storage (EES) systems store electricity and convert it back to electrical energy when needed. 1 Batteries are one of the most common forms of electrical energy storage.

Typically taking 2 to 4 years, this multi-step process--including conducting environmental and engineering surveys--determines how to safely interconnect the project to the grid through the ...
