How much lithium will Russia produce in 2030?

Russia plans to produce at least 60,000 tonnes of lithium carbonate in 2030, the natural resources ministry said on Monday, as Moscow seeks to reduce its dependency on imports and boost production of high-capacity electric batteries.

When will lithium production start in Russia?

"Industrial lithium production in the country will begin in 2030," the ministry stated. President Vladimir Putin said last month that Russia should speed up its plans to mine lithium deposits. Demand for lithium has surged in recent years as Russian companies work on the mass production of lithium batteries and electric vehicles.

How much lithium does Russia have?

Lithium, a metal essential for electric vehicle production, is included on the list of 50 minerals deemed critical by the U.S. Geological Survey. Russia reported having 3.5 million tons of lithium oxide reserves. The U.S. Geological Survey estimated Russia's lithium reserves at about 1 million tons in 2024, the world's 14th largest.

Why is lithium so important?

Lithium and other critical minerals, including rare earth metals, have gained global attention in recent months, as U.S. President Donald Trump aimed to counter China's dominance in the sector by offering production deals to Ukraine and Russia.
