When the knee joints are extended, the muscles do negative work and the BMEH recovers the negative energy generated to generate electricity. The BMEH recovers negative energy ...

The effects that do occur in any specific case are strongly dependent on several factors related to how contact is made with the source of electricity. These factors include current path, moisture, if there ...

We observe this in nature as the First Law of Thermodynamics: Your body uses chemical potential energy stored internally to do work, and that process also generates thermal energy, which you ...

Energy is the capacity to do work. It is a quantitative property that can be transferred, but not created or destroyed, a principle known as the law of conservation of energy.

In this study, we developed an energy-harvesting exoskeleton that can generate electricity during LW, downhill walking (DW), and stair descent (SD) without sensors.

The most important issue in this field is how to design an energy harvesting system that could generate power during the negative-work phase of human walking while meeting the requirements of small ...

In summary, the knee energy-harvesting exoskeleton developed in this study can generate substantial and sustainable electricity with little extra effort, which indicates its potential as a means to charge ...

The most important issue in this field is how to design an energy harvesting system that could generate power during the negative-work phase of human walking ...
